River Valley Ingredients (Tyson Farms, Inc) Wastewater Release

Master ID 892 NPDES Permit AL0040843

June 6, 2019

A release of partially treated wastewater occurred at the River Valley Ingredients plant resulting in an unpermitted discharge to Dave Young Creek and the Mulberry Fork River. The initial volume of the release was estimated between 180,000 and 800,000 gallons. Later calculations by the facility resulted in an estimate of 220,000 gallons as the release volume. The facility filed NRC report #1248248

Cura Emergency Services was contracted by the facility to manage the response operations. Tyson will be providing the Department a report detailing contractor response activities associated with the spill response.

ADEM’s Paul Ennis and Shawn LaGrone were dispatched to the facility on the morning of June 6th to document conditions and observe initial response activities at the facility. ADCNR was notified of the developing fish kill and Keith Floyd, Division 1 Fisheries Biologist was dispatched to the site to assist ADEM with the fish kill investigation.

Cura and Tyson personnel were instructed to collect downstream water samples at three locations on the Mulberry Fork River on June 6th and have them analyzed for the facility discharge permit parameters.

ADEM’s Bruce Freeman deployed on the afternoon of June 6th to begin tracking the released material as it flowed down the Mulberry Fork River. An assessment was conducted at the I-65 Bridge at approximately 6:00 PM on June 6th. The Dissolved Oxygen (DO) level at this location was 0.26 mg/l and an E. coli sample collected at the same time was >9,678.4 MPN/ml. There were dead and dying fish observed at this location. A water quality sample was collected at this location. See Attachment 8 for laboratory reports / analytical data.

The I-65 Bridge is approximately 6 river miles downstream of the facility.

See Attachment A for photographs.

ADEM personnel: Keith Floyd, Division 1 Fisheries Biologist Supervisor
ADEM personnel: Paul Ennis, Emergency Response Staff
Shawn LaGrone, Ambient Unit Chief
Bruce Freeman, Decatur Branch Chief

June 7, 2019
The following day assessments of the Mulberry Fork River moved further downstream to the County Road 35 site, which is approximately 14 river miles downstream of the facility. At 9:30 AM, the DO reading at County Road 35 was 6.12 mg/l and at 10:30 AM it had decreased to 5.82 mg/l. This appeared to be the front edge of the plume of released material. Fish were not distressed or dead at this location at this time. The team transitioned upstream throughout the day and began to observe depressed DO levels. Dead or dying fish were observed for about a three mile stretch going upstream on the Mulberry Fork River before finding DO levels recovering to 6.08 mg/l range upstream of the plume of released material at the I-65 Bridge.

Upon returning to the County Road 35 site at 4:00 PM, it was noted that fish were now dead and dying and the DO level had decreased to 0.3 mg/l. An E.coli sample was collected at this location and the results were 10,462 MPN/dl.

ADEM staff collected an additional water quality sample on the afternoon of June 7th at the County Road 35 location. See Attachment B for laboratory reports / analytical data.

By approximately 8:00 PM it was observed that DO levels began to recover at the County Road 35 site to a level of 5.2 mg/l. Rain had begun to influence the Mulberry Fork River at this time.

A background E. coli sample was also collected above the facility outfall on the afternoon of June 7th. The results were 104.6 MPN/dl.
ADCNR personnel: Keith Floyd, Division 1 Fisheries Biologist, Supervisor  
Chris McKee, Division 1 Fisheries Biologist

ADEM personnel: Cal Johnson, Emergency Response / ichthyologist  
Ryan Baty, Emergency Response  
Bruce Freeman, Decatur Branch Chief  
Shawn LaGrone, Ambient Unit Chief

June 8, 2019

ADEM and ADCNR staff again deployed to the Mulberry Fork River on June 8th. The plume of released material had moved below County Road 35 at this time based on near normal DO levels at this location. Due to local rainfall, the flow in the Mulberry Fork River had also begun to increase by the morning of June 8th.

Observations approximately 3 miles downstream of County Road 35 identified the upper end of the plume of the released material. Additional downstream observations were made that also identified depressed DO levels. The next access point was at the confluence of the Mulberry Fork River with the Sipsey River. The confluence of the rivers is approximately 28 miles downstream of the facility and 14 miles downstream from the County Road 35 site. There were no indications by the end of the day on June 8th that the plume had reached or impacted the confluence of the two rivers. The DO at the confluence of the Mulberry and Sipsey Rivers was 6.89 mg/l at 6:00 PM.
ADCNR personnel: Keith Floyd, Division 1 Fisheries Biologist, Supervisor  
Chris McKee, Division 1 Fisheries Biologist

ADEM personnel: Cal Johnson, Emergency Response/ichthyologist  
Ryan Baty, Emergency Response  
Bruce Freeman, Decatur Branch Chief

June 9, 2019

Early morning observations on June 9th indicated that the flow of water in the Mulberry Fork River and the Sipsey River had risen rapidly overnight. There were indications of low DO levels and distressed fish observed at the confluence of the two rivers by ADCNR staff. Downstream assessments were begun to determine where the majority of the dead fish had been deposited by the increase flow and water levels in the river system. The majority of the fish were located upstream of the I-22 Bridge and below the confluence of the Mulberry and Sipsey Rivers.

ADCNR staff recorded the DO readings on June 9th and will be included in the ADCNR Fish Kill Report.

Facility personnel and their contractors begun to mobilize to collect dead fish.
ADCNR personnel: Chris McKee, Division 1 Fisheries Biologist

ADEM personnel: Bruce Freeman, Decatur Branch Chief

June 10, 2019

River observations on June 10th documented that the rising river levels and rainwater from previous days of rain had diminished any residual impact of the release. There were no dying or distressed fish at any observed location throughout the river system. DO levels were back to normal levels for the Mulberry Fork and Sipsey Rivers at all survey locations.

ADEM assessed the cleanup at the facility and determined that response actions were complete at the facility.

Dead fish collection continued by the facility contractors.

ADCNR personnel: Keith Floyd, Division 1 Fisheries Biologist, Supervisor
Chris McKee, Division 1 Fisheries Biologist
ADEM personnel: Cal Johnson, Emergency Response/Ichthyologist
Bruce Freeman, Decatur Branch Chief

June 11 and 12, 2019

Dead fish collection continued by the facility contractors.

June 13, 2019

E. coli samples were collected at six locations within the Mulberry Fork River watershed by ADEM personnel. All sample results were below existing water quality values. ADEM personnel also assessed the river for dead fish during the sampling event. There were no dead fish noted anywhere in the survey area and it appeared that dead fish collection had been completed by the contractors.

ADEM personnel: Bruce Freeman, Decatur Branch Chief

Collected By: BRUCE FREEMAN
Collect On: 6/13/2019 at 1440
Submitted On: 6/13/2019 at 1610

Sample Description:
Received By: BRUCE FREEMAN
Logged in by: JLC
Validated by: JLC on 6/14/2019

County: CULLMAN

The results on this report are from the sample that was received by the ADEM Laboratory System and is referenced above. The sample was analyzed using standard EPA-approved testing procedures and quality analysis protocols. Instrument calibration and quality control are within acceptable limits of precision and accuracy. A close review by our Quality Assurance Program certifies that all test holding times were met and our strict quality assurance standards were observed. Any results inconsistent with the above standards are qualified.*
